

## Systems Management

While new applications often offer valuable business capabilities, large-scale deployment projects have become less feasible given the difficulty and cost associated with such a project – resulting in potentially placing businesses at a competitive disadvantage. **THE MHS GROUP** provides a comprehensive solution for planning, testing, deploying, analyzing, and optimizing software applications using Microsoft's Systems Management Server 2003 to deliver end-to-end capabilities to help enable the seamless deployment of the latest business productivity application to every device - from server to handheld.

### Reducing Total Cost of Ownership

As corporations are becoming more focused on reducing costs, the ability to accurately track corporate software throughout the lifecycle and stay compliant with vendors' licensing policies has become a necessity. **THE MHS GROUP** provides an integrated way to not only know what applications are installed, but to track application usage as well. It can track which users are running applications, for how long, and how many instances concurrently. This functionality is fully integrated with an enterprise scalable solution allowing you to save money on potential new application purchases, while staying compliant on existing products, and effectively phase out unused applications, resulting in enterprises using what is paid for and paying only for what is used.

### Securing the Enterprise

Failing to implement a comprehensive patch management strategy could have severe consequences for enterprises - critical business production systems may fail, or security-sensitive systems could be maliciously exploited - all leading to a potential loss in productivity, time, access to business applications and subsequent revenue.

### Supporting a Mobile Workforce

As corporate workforces evolve from cubicle dwellers to road warriors, this increased degree of mobility introduces additional challenges for managing PC's and devices.

### Management Services Integration

Taking advantage of the built-in management capabilities within the Windows systems, management can reduce costs by not duplicating functionalities already available. By integrating with the Windows platform, and then investing in the backend technologies, **THE MHS GROUP** provides an increased level of manageability for Windows-based clients.

**THE MHS GROUP** provides a comprehensive solution for addressing and resolving your change and configuration needs enabling you to:

- Deliver critical business applications reliably.
- Reduce software costs and stay compliant by understanding the installed application base and their usage.
- Improve security through increased vulnerability awareness and reliable targeted delivery of updates.
- Deliver enterprise management to the growing mobile workforce.
- Reduce operational costs.
